

Bio-Match® Technology:
Engineered for Vaginal Physiologic Compatibility

A healthy vaginal ecosystem relies on optimal pH, the correct osmolarity, and the maintenance of a Lactobacillus-dominant microbiome. Bio-Match® products apply the principles of **biomimicry** by replicating the physical and biochemical properties of natural vaginal secretions to help reinforce the vagina's innate protective functions and support a healthy microbiome.

Bio-Match®

- 3** **Proprietary Lactic Acid:** Contains both D- and L-isomers of lactic acid to reinforce natural acidification, support a diverse range of Lactobacillus species, and enhance defense against pathogens
- 2** **pH Balanced:** Formulated to support and maintain vaginal pH in the optimal acidic range (3.8–4.2), which suppresses pathogenic overgrowth and supports Lactobacillus dominance
- 1** **Iso-osmotic Formulation:** Matches the osmolarity of natural vaginal fluid to help preserve epithelial integrity and prevent dehydration and barrier disruption
